

# BULLARD WASH CHANNEL IMPROVEMENTS - PHASE II

## Brownbelt Channel Treatment-

This approach could be described as a natural or native design solution. The concept of a brownbelt treatment would be most identifiable by the lack of turf areas, and a preponderance of native Sonoran vegetation. Larger plant groupings would likely be placed on the higher edges of the side slopes, and outside the channel itself, to insure an unobstructed flow of storm waters. However, plant material would be introduced into the channel profile to help create the natural or native character. In addition, the brownbelt treatment would include a ground cover of native soils and stones.

## BROWNBELT DESCRIPTIVE
